This Supports "Androgens in Human Evolution," *Rivista di Biologia / Biology Forum* 2001; 94: 345-362

James M. Howard, Biologist, Independent

I suggest this article by Smaers and Dr. Soligo may support my explanation of human evolution: "Androgens in Human Evolution," *Rivista di Biologia / Biology Forum* 2001; 94: 345-362.

"The brain also enlarged as a response to the effects of increasing testosterone. The brain produces androgen receptors throughout. Testosterone exposure of the male human brain, in utero, results in increased head circumference of male brains at birth (Liebermen L.S., 1982). Androgen treatment of female monkeys increased performance to male levels, on an "object discrimination task." Both male and female performance levels were adversely affected by lesions in the orbital prefrontal cortex, indicating that "gonadal hormones may play an inductive role in the differentiation of higher cortical function in nonhuman primates." (Clark & Goldman-Rakic, 1989)."
